Introduction to

Cynthia's Advanced Indicators for the Breakout Trend Trading Simple System

NOTE: please start with the Basic system first and learn how to understand and use the basic indicators before you attempt to use the Advanced Indicators

IMPORTANT: In order to achieve good results you must read AND FOLLOW THE MAJOR RULES BELOW!

- 1. Recommended Time Frames: any**
- 2. Recommended pairs: strong volatile trending pairs. EX: I trade the NzdUsd, AudUsd, EurUsd, GbpUsd, EurJpy, AudJpy, GbpJpy and UsdCad during the London/NY sessions, and the EurAud, AudJpy, EurJpy, NzdJpy, ChfJpy and GbpJpy during the Asian session.**

3. It is highly recommended to monitor economic news events at Forex Factory:
<http://www.forexfactory.com/calender.php>

I look every Sunday to plan my trading week. Any orange or red economic news events in my timezone can be traded in a 3 chart setup of 1 minute, 5 minute and 15 min charts. Trade **ONLY** in the direction of the 15 min chart and use the 1 min chart to get the perfect entry. Monitor the trade in the 5 min chart. And use a Trade Manager!

Set up your filters for your timezone and to show only the orange and red news events. Leave this webpage open and refresh daily and plan your trading day in advance, either to trade the major news events or to avoid them 30 min before and after.

4. Trade according to color. For the Advanced system, you will also be using a Triangle Breakout Indicator and a Fibonacci Heat Map that shows the red sell zone and blue buy zone and all the fib levels... everything is automatically adjusted for you according to the price action. The Triangle Breakout Indicator will be giving you a buy or sell alert with targets.

5. All colored signals need to be the same before you enter a new position. Do not enter a trade until the iTrend indicator crosses (in the lower window).

- Aggressive trades can be entered when the iTrend volatility line crosses between the 40-60 rsi line and for the Trend Slope to be the same color as the Signal_Entry_Stop. (best for higher timeframes)
- Conservative trades should wait for the iTrend volatility line to cross up through the 60 rsi line and for the Trend Slope to be the same color as the Signal_Entry_Stop. (best for lower timeframes)
- Several training videos will show you examples of conservative & aggressive entries

6. Use sensible money management. My most recommended money management system is taught by the MAX team, please visit their site and sign up for a FREE introductory webinar:

http://www.cynthia-recommends.info/The_MAX_Trading_System.htm

More about the MAX trading and money management system is at the end of this ebook.

7. As with any trend trading system, you are looking for breakouts and trying to avoid consolidation periods of low volatility. To find the high volatility entries, we use the iTrend in combination with a special RSI volatility breakout box that I devised. Most of the training videos and screenshots in the PDF show how to use the iTrend in combination with the special RSI box in the lower window.

Of course not every trade will be profitable, there is no holy grail in Forex. Losing trades will be closed by your trailing stop loss automatically but by the end of the month a good profit is sure to be yours.

Installation and Setup

In your Welcome email, you were given a Universal one click auto installer that works on any MT4 Build you are using. Please save your Thank You email for future platform installations. Be advised that if you receive a refund, your auto installation link will be deactivated and your trading system will quit working.

The Easy Forex Breakout Simple System requires the MetaTrader 4 trading platform to function.

If you already used the Universal one click auto-installer immediately after purchasing or from the link in the Thank You email, your trading system is already installed on your MT4 trading platforms with all the files in the correct folders. Please save this PDF guide to your desktop Cynthia folder.

All your indicators will now be in Custom Indicators and your templates will be under the Charts tab ---> Templates.

NOW YOU MUST APPLY THE TEMPLATE TO CHARTS YOU WISH TO LOOK AT. ALL TEMPLATES ARE FULLY LOADED WITH ALL THE INDICATORS.

Setting Up Your Charts and Creating a Profile:

1. Pick out 3-4 major trending pairs to trade (or only 2-3 pairs if your screen isn't very wide)
2. Make a Profile that has the 4 hr charts at the top going across and then a 1 hr chart under those going across and then a 15 min chart under the 1 hr charts going across
3. Attach the "Cynthia_advanced_simple_system" template to each chart (select your chart by clicking on it, then go to Charts, Template, Load Template and select the template ... repeat for each chart).
4. Next, save your chart setup as a Profile by going to File, Profiles, Save As, and name it "Cynthia_advanced_simple_system".

IMPORTANT TIP: DO NOT USE SPECIAL CHARACTERS WHEN SAVING YOUR PROFILE NAMES ... EXAMPLE: DO NOT USE ANY OF THESE CHARACTERS: " / _ () + = , ETC. IF YOU USE SPECIAL CHARACTERS YOUR PROFILES WON'T WORK WHEN YOU TRY TO BRING THEM UP. YOU CAN USE THE - (DASH).

5. To access a certain profile, go to the top of your trading platform, and next to the New Chart icon, there is an icon that says Profiles when you run your cursor over it. Click to open and select your desired profile. It will overwrite all other charts in your platform and it will say at the bottom of your platform the name of the profile that you are now using. You can also change the profile you are watching by clicking the name of the profile at the bottom of your platform and selecting from the list a different profile ...the profile will then change.
6. Create "Session" Profiles. Choose the best pairs to trade the London, New York and Asian sessions. Make a Profile for that session and Save As and name it. Trade each session from that Profile.

The currency pairs can be anything you like to trade. You can set up your charts with any time frames you like. For instance, instead of the 4 hr charts at the top, start with 1 hr charts, and below change the time frame to 15 min and below that to 5 min. For scalping, I use a 15 min, 5 min and 1 min chart setup.

When you are looking at a currency pair to trade, you first look at the top 4 hr chart to determine the major trend..then look at the 1 hr chart underneath to see the medium trend, and then look at the 15 min chart to see the faster trend.

I use a faster chart for better entries into a slower chart. **EX:** use a 15 min chart for better entries and exits according to the trend in a 1 hr or 4 hr chart. Or use a 5 -15 min chart for a better entry/exit while trading in a 1 hr chart. And use a 5 min chart for better entries/exits while trading in a 15 min chart.

ALWAYS TRADE IN THE DIRECTION OF THE HIGHER TIMEFRAME.

At the far right is a dotted white vertical line that follows the price....you can always quickly at a glance see where the price is at.

I never trade just in one time frame by itself, as you need to look at the higher time frames to see the major trend directions and you need the lower time frames to get the best entry.

For news trading, I use a 1 min, 5 min and 15 min chart and I trade only in the direction of the Daily chart.other than that, there's too much noise in a 5 min chart and the whipsaw is too great so I personally never trade just in a 5 min chart.

Here's a video of how to quickly and easily change the charts in your profile if you want to look at different pairs:

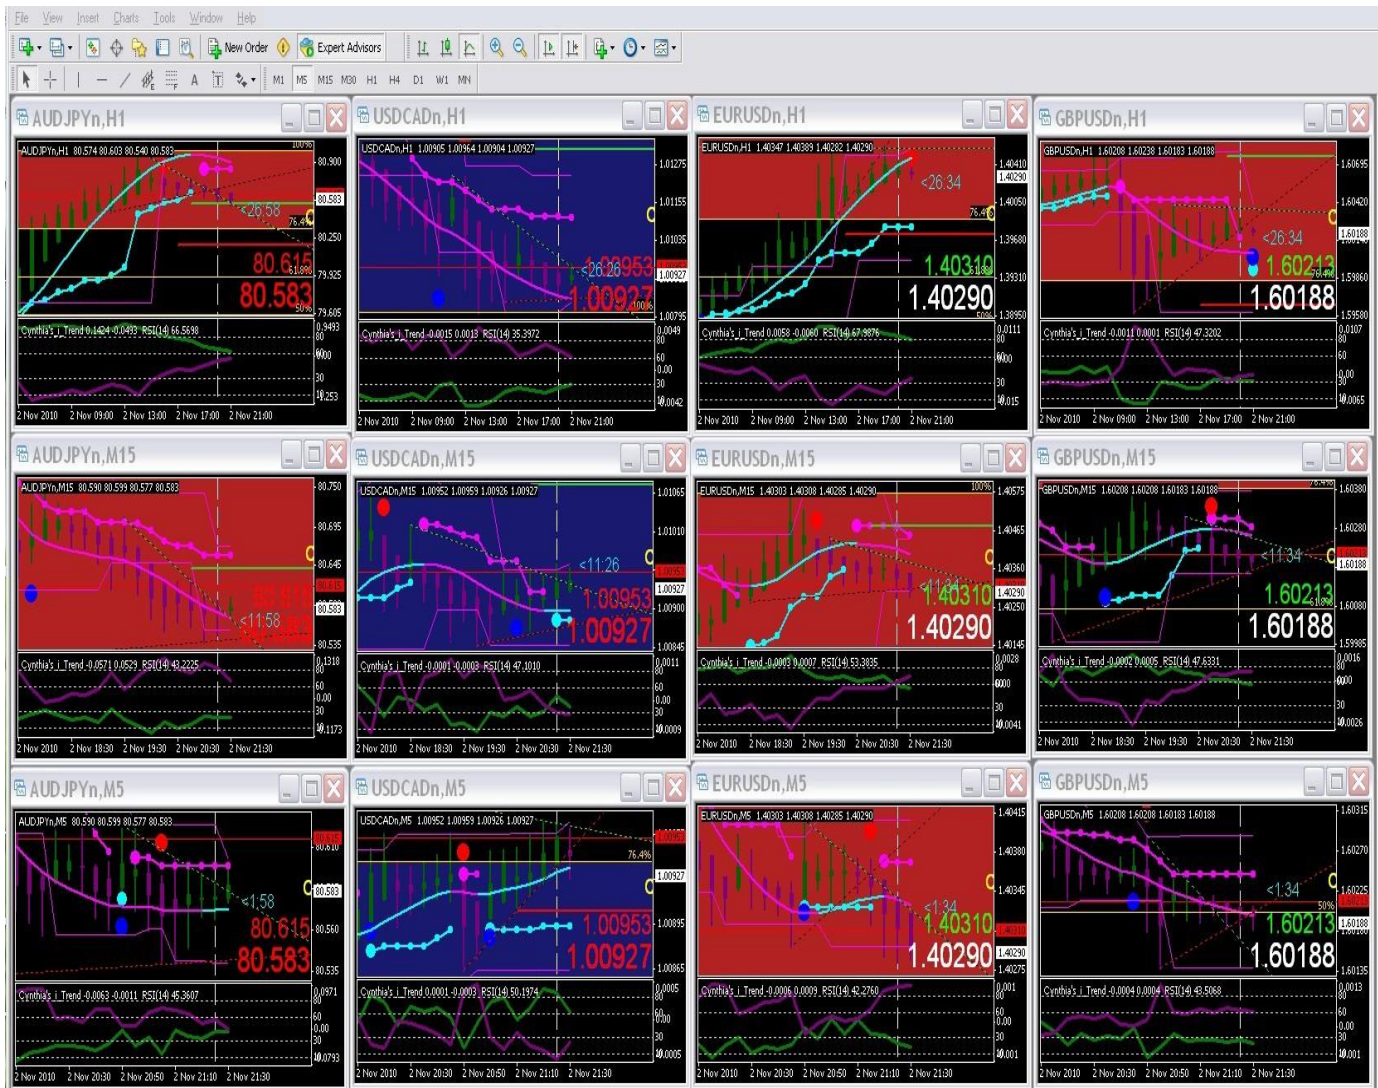

<http://www.youtube.com/watch?v=zGMYS7E7qu8>

How to trade out of your basic profile setup:

http://www.youtube.com/watch?v=1UrJdhETC_Q

Here is a screen shot that illustrates the profile setup with the Advanced indicators but without the bonus indicators:

You can set up your Profile charts with any pairs and any time frames you like. When you are looking at a currency pair to trade, you first look at the top 1 or 4 hr chart to determine the major trend..then look down at the next chart underneath to see the medium trend and then look down at the lower chart to see the faster trend. Use the bottom chart to open a trade to get a better entry.

I use a faster chart for better entries into a slower chart. **EX:** use a 15 min chart for better entries and exits according to the trend in a 30 min, or 1 hr or 4 hr chart. Or use a 5 -15 min chart for a better entry/exit while trading in a 1 hr chart. And use a 5 min chart for better entries/exits while trading in a 15 min chart.

Set up 2-3 major pairs using the 3 time frames.

If you set up the pairs using the 3 timeframes, then you save them as a profile. If your monitor only supports 2 pairs at a time, that's ok. Make a new profile for every two pairs. So you can switch easily between profiles to see what's happening in more pairs.

If you like to trade the 4 hr chart, set up your timeframes this way:

the upper chart=daily
the middle chart=4 hr
the lower chart=1 hr

or try this setup:

upper chart=4 hr
middle chart=30 min
lower chart=15 min (you'll have more trade opportunities in this setup)

or this setup:

upper chart=30 min
middle chart=15 min
lower chart=5 min (you'll have even more trade opportunities in this setup)

for scalping, use this setup: (for news trading, add a Daily chart and only trade in that direction)

upper chart=15 min
middle chart=5 min
lower chart=1 min (you'll have even more trade opportunities in this setup)

When trading in a 3 time frame setup, you only enter trades when all the colors are the same in each time frame. Because you'll actually be placing the trade in the lowest time frame chart, that means that sometimes you'll have to wait for a pullback to finish and the trade resume the main trend as in the upper time frames. When the trend resumes and the i-trend crosses or goes above 60 rsi in the lower time frame, and all the colors in all the charts are the same, that's when you enter a trade.

So the key is to wait for the pullback to finish in the lower time frame. Then when it is the same color as the upper time frames, then you enter. If the middle chart is in a pullback also and not the same color, then you have to wait for it to change too.

Patience is the key also. If you just learn how to wait for a pullback (retracement) to finish and then jump in, your trading will be successful.

HOW TO USE YOUR ADVANCED INDICATORS

The Fibonacci Heat Map AKA Cynthia's AutoFib TradeZones and Cynthia's Triangle Breakout Indicators – Your Advanced Indicators

The Triangle Breakout indicator, which gives you triangle support and resistance and your **short term buy target (the thick green line)** or **sell target (the thick red line)**, works great in conjunction with the fib lines.

The dashed red line is the support and the dashed green line is the resistance, and both are dynamically and automatically adjusted as the price moves and a new triangle pattern emerges. As the price moves and the new triangle is re-drawn, the red and green solid line targets are also automatically adjusted.

On the next page is a screenshot of just the Triangle Breakout Indicator on a chart:

The dashed red line is support and the dashed green line is resistance. The solid green line is your buy target and the solid red line is your sell target.

You will get popup alerts when the price breaks through the Triangle Breakout support or resistance.

Here is what the signal alerts mean:

UTL = upper triangle (trend) resistance line has been broken

LTL = lower triangle(trend) support line has been broken

If the price draws a triangle with solid lines showing the triangle, the upper trend line will be a buy alert if it breaks up thru this line. It means the price is breaking up thru resistance and you will get the UTL buy alert...place the trade then if all other indicators and itrend confirm the buy entry...and your target is also shown. It will be a solid green line as in the picture.

When the price breaks down thru the lower trend line, it will signal a LTL sell alert, as the price has broken down thru support, and shows also your target, which is a solid red line.

Make sure that your other indicators are in alignment and the colors are all the same before you place a trade.

Much of the time, the target lines will sit on a fibonacci level. This is a very strong take profit level.

The Fibonacci Heat Map (aka Cynthia's AutoFib Trade Zones) is the red sell zone and the blue buy zone & the fibonacci percent levels are automatically drawn by the indicator and adjust as the price changes.

Here's a training video showing how to trade using the Fibonacci Heat Map and Triangle Breakout:

<http://www.youtube.com/watch?v=r6jilQUj5x4>

Here's a video I made of how to use the Fibonacci Heat Map and the Triangle Breakout, along with the bonus indicators:

<http://www.youtube.com/watch?v=j06lc4gZ9QU>

The next screenshot shows you the Fibo Heat Map and the Triangle Breakout Advanced indicators as well as the bonus indicators.

It's hard to see in the next screenshot, but the Fibonacci Heat Map shows you all the fibo percentage lines. Basically, if you sell from the red overbought zone, your ultimate target is 100% at the bottom of the blue zone. If you are buying from the blue oversold zone, your ultimate target would be the 100% at the top of the red zone.

However... price never goes up or down in a straight line!

Price often hits the 38.2%, 50% and 61.8% levels, re-traces, and then continues. Your target can be those fib lines especially if the triangle targets are close. The Auto Fibo Heat Map will automatically plot all your fib lines. you just need to learn how to use them for price targets.

You should also learn how to use the fib lines for trading retracements. It's never a straight shot from 100% to 0% and vice versa...the price moves, then re-traces and then moves again ... you need to learn how to see the retracements, which is best done in a 5 and 15 min chart, with a 30 min chart to see the major direction.

Fibonacci analysis is a leading indicator. What this means is that you can use the fib levels to determine the probable turning points in the market before the price gets there! Yes, in advance!

This means that it predicts future price movements rather than analyzing past movements or averages. The future is what we need to know when we are trading, so this gives this method an advantage over other chart analysis systems from the get-go.

Fibonacci retracements or extension targets offer a high degree of precision and may be used as leading indicators. If you are interested in knowing how to increase your profits in forex trading, then you'd be interested in Fibonacci analysis because professional traders are responding to Fibonacci levels. Fibonacci levels become a self fulfilling prophecy because so many traders are reacting to them.

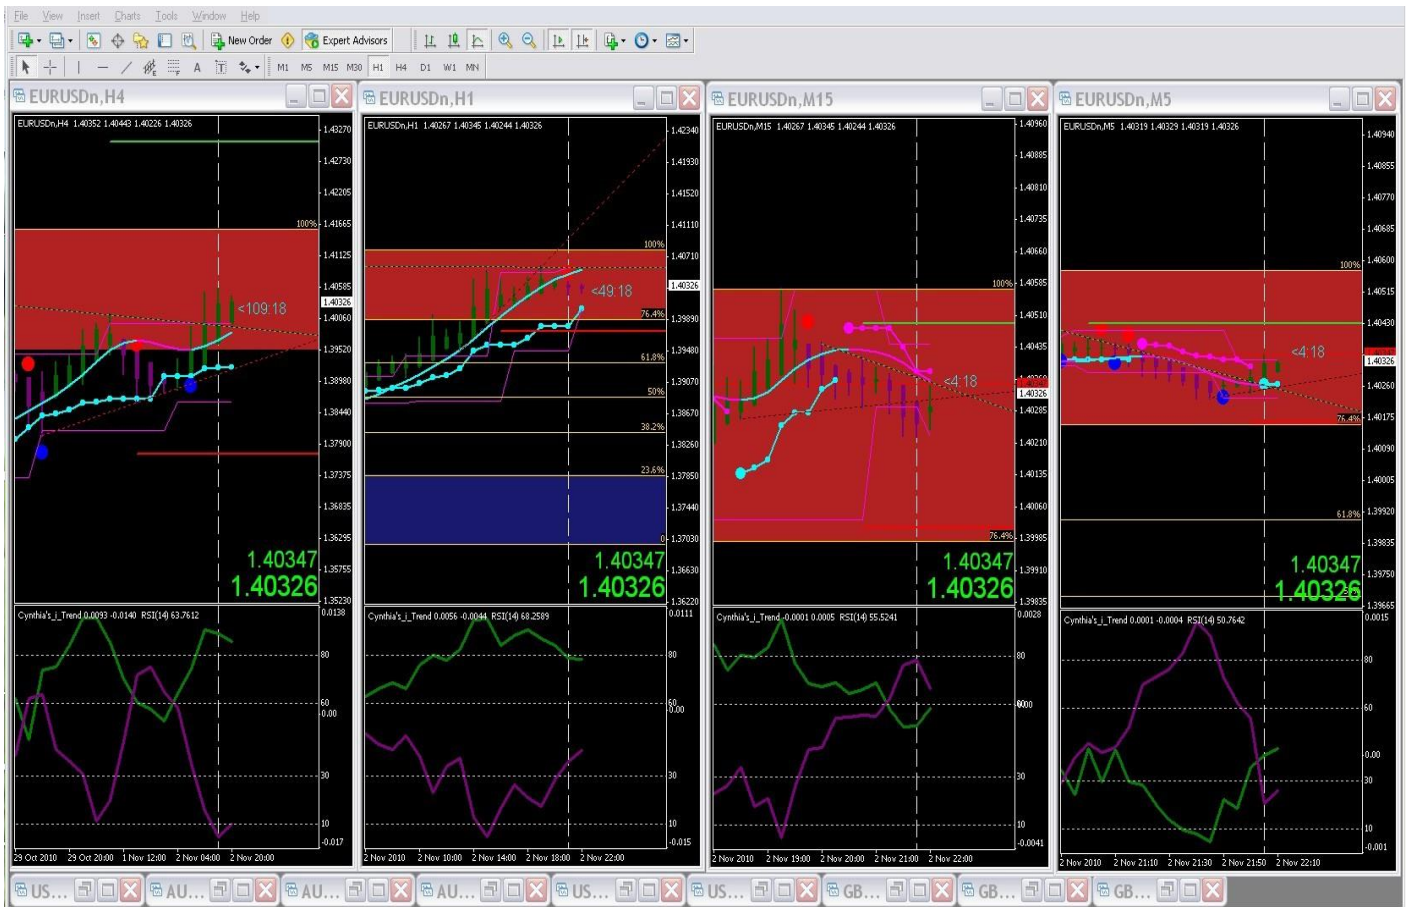

For more detail on how to use Fibonacci lines, please watch this video:

<http://www.youtube.com/v/pVqMJzkyMGM?fs=1&mp>

Using Fib Levels as Price Targets

Below is a screenshot with the AutoFib Heat Map and Triangle targets. I've set up the charts to be 4 hr, 1 hr, 15 min and 5 min.

You can easily see that the 4 hr chart has yet to hit the fib target high of 100%, which is 1.41665...so we can predict that the price is going to continue up long-term. The triangle target is even higher, just below 1.43270.

In the 1 hr chart, the price has almost hit the 100% target.

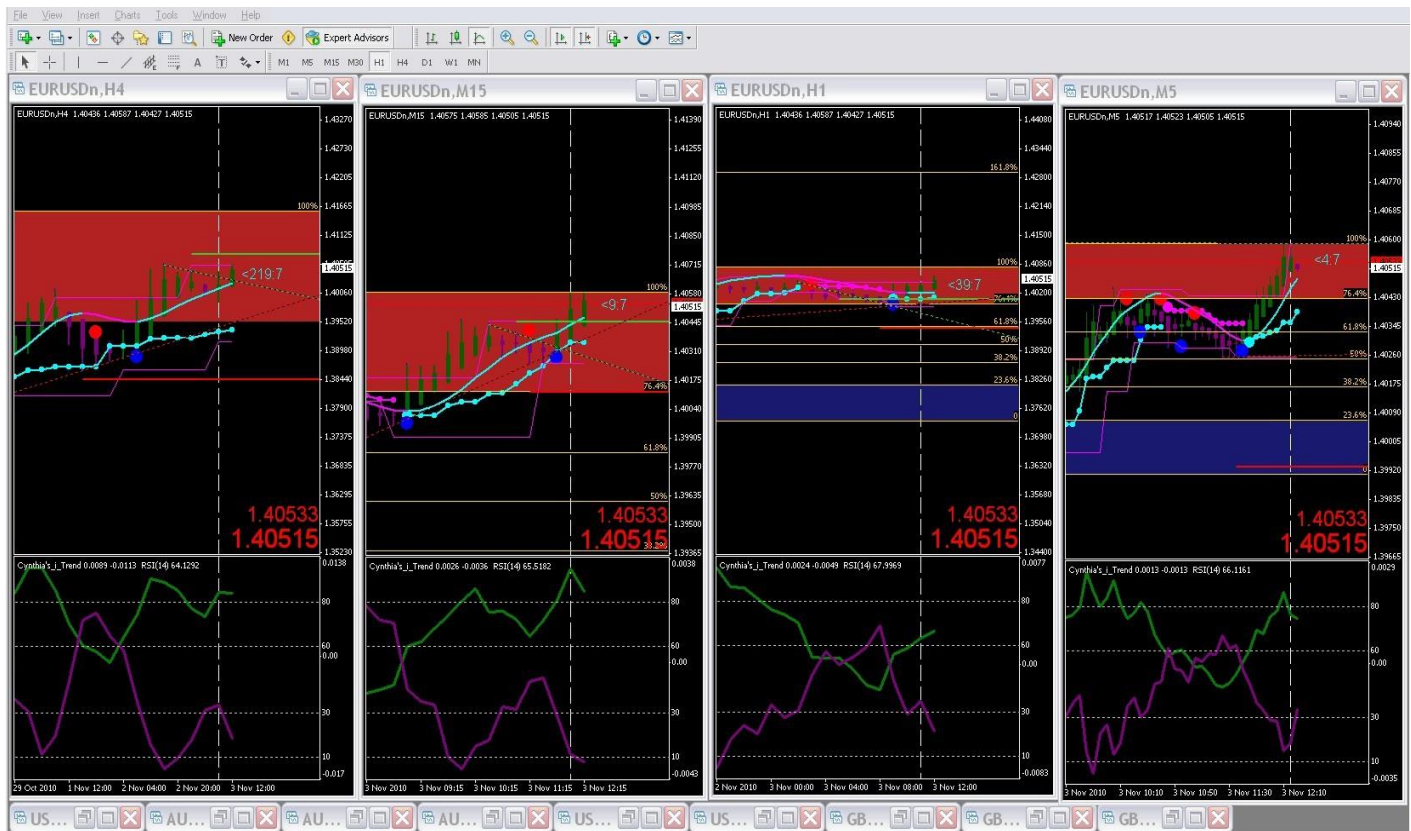

In the 15 min chart, it had a spike that already hit the 100% target and also hit the triangle target. Resistance is the upper congestion hot pink line and the triangle target is right on it. So we would watch for the next long trade opportunity in the 15 min chart and we know that the short term target is the 100% level in the 1hr chart and then possibly the 100% level in the 4 hr chart.

The red zone is overbought territory so caution is advised when trading long. The blue zone is oversold territory so caution is advised when trading short.

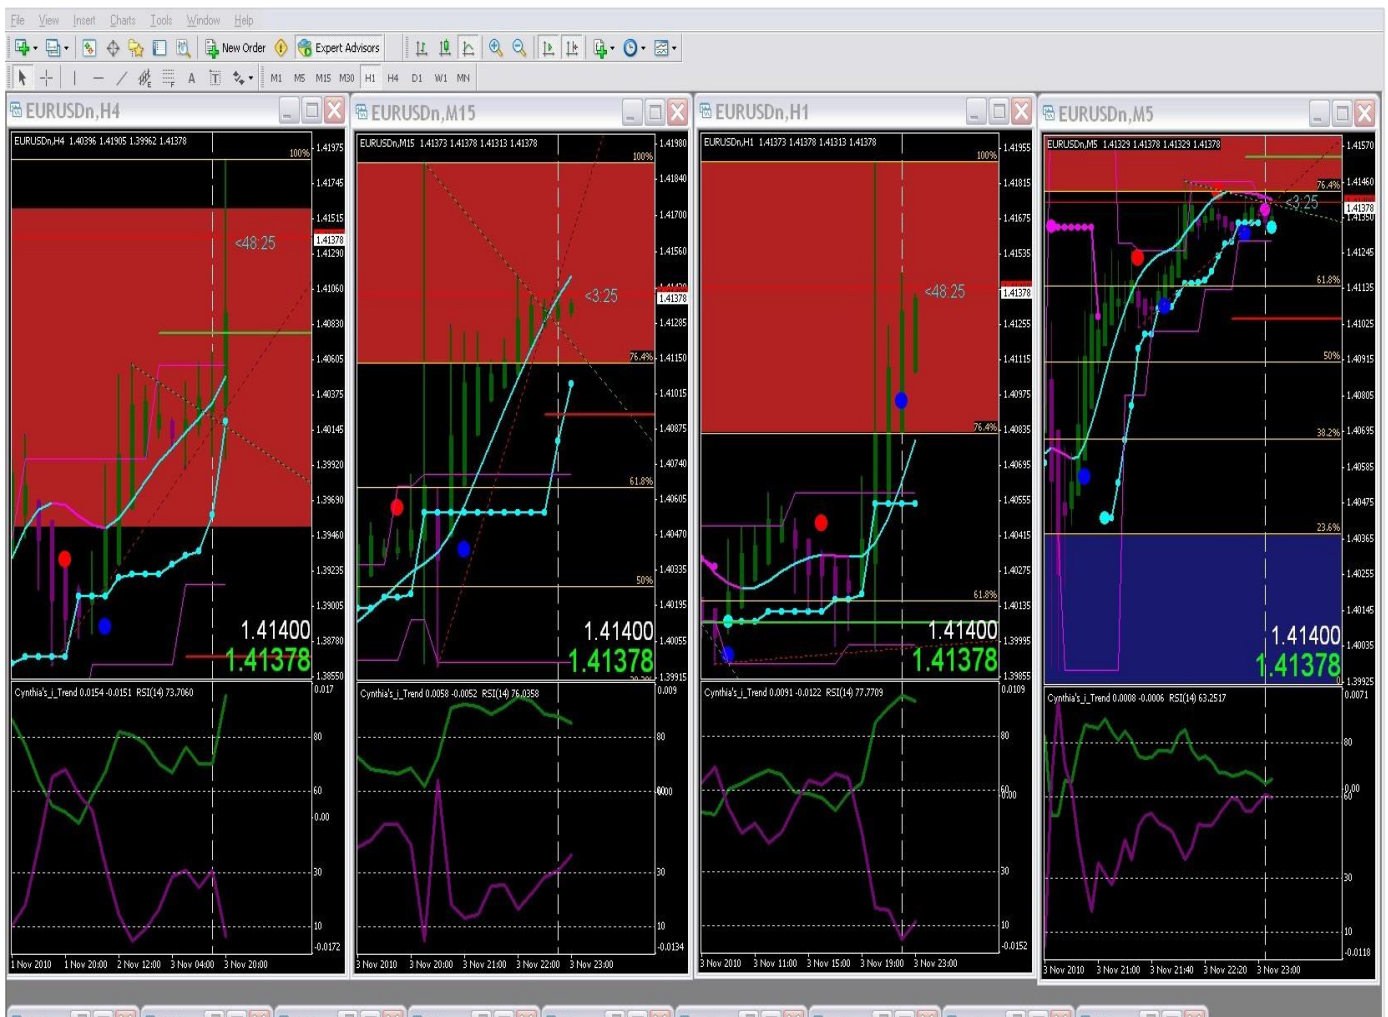

Trading when in a red zone means that you want to sell at the top. Trading in a blue zone means that you want to buy at the bottom.

Below is a screenshot of how I set up my 4 charts so I can trade the retracements. I use a 15 min chart for best entries and exits when trading the 4 hr chart. I use a 5 min chart for best entries and exits when trading the 1 hr chart.

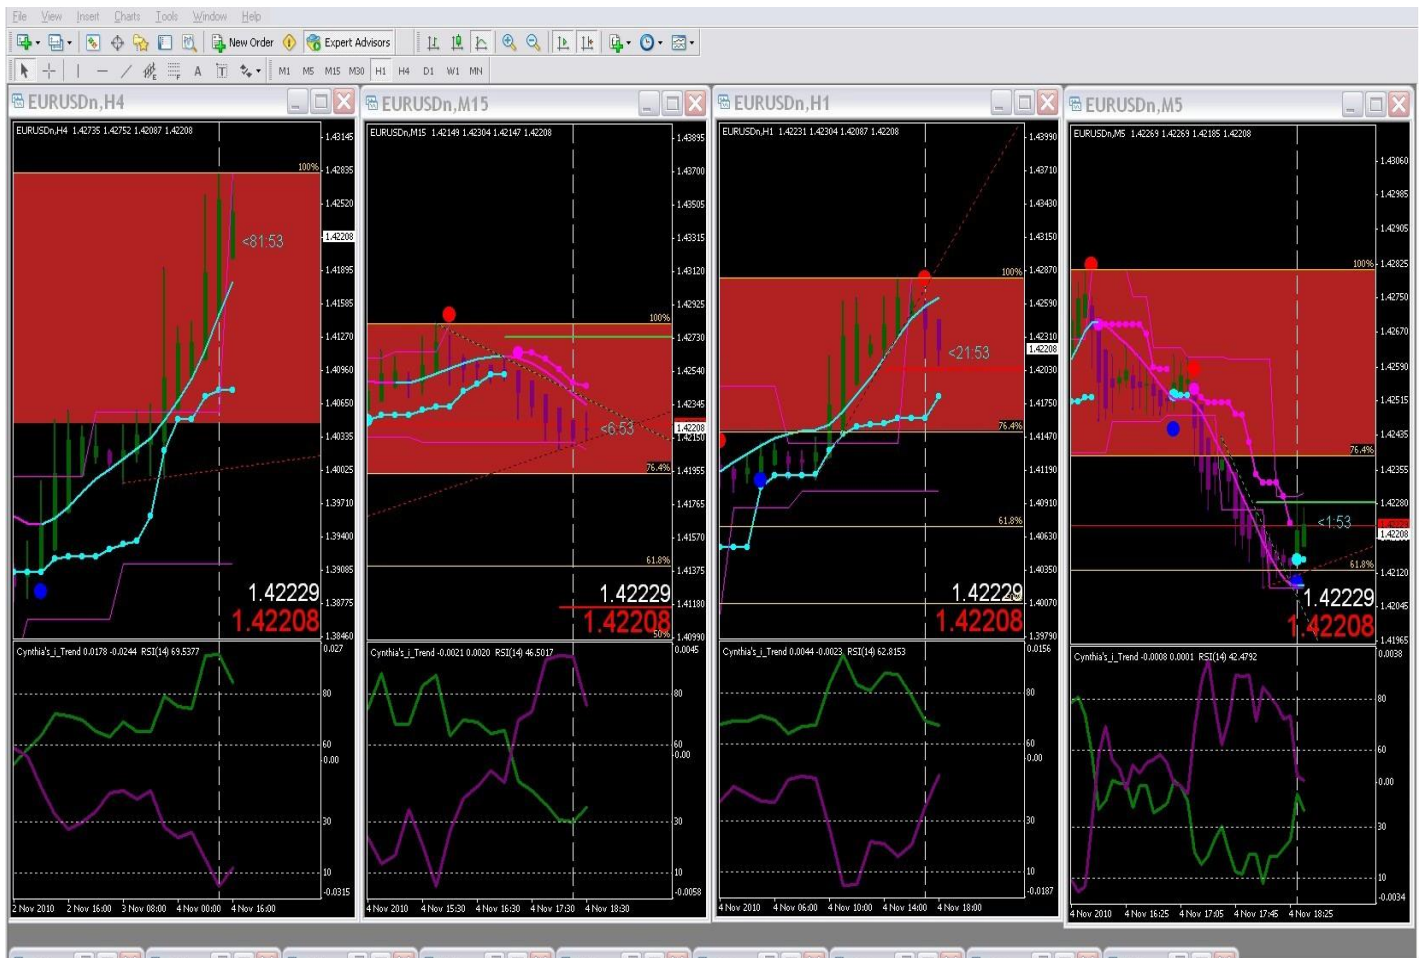

Below is a chart showing how the price blew thru the top of the triangle target and reached the 100% in all four charts. This was after a mid-day U.S. FOMC report. The 5 min chart has re-adjusted the fibo red zone to reflect the new higher price.

This chart is the morning after the FOMC report:

The price hit the new higher 100% target in all 4 charts and is now bouncing back down. We can see the 15 min chart doing the retracement and the best entry and exit was in the 5 min chart.

The red dot has appeared in all charts except the 4 hr chart so it's possible the price still has some upside to it. When you see the price and indicators in the 15 min chart start to signal buy again, you can jump in long to see where the top is.

The Fibo Heat Map in the 4 hr chart will be increased upwards and when the red dot finally appears, then exit all long trades.

Here's a chart where the 5 min euro has retraced and hit the 61.8% level. You could have placed a pending buy order at the 61.8% price level and set it for a 20 pip take profit with a 15 pip stop loss and picked up a quick easy stress-free 20 pips. This is the predictive power of using fib levels in action!

Here's a blow up of the euro 5 min chart showing the successful 61.8% retracement and the subsequent resumption of the downtrend. At this point you could place a market sell order with your target at the triangle target of 1.41950, which is just above the 50% fib line.

You could also place another pending buy order at the 50% fib line with a 20 pip TP and 15 pip SL to play the retracement bounce.

If you practice this style of trading, you could do very well. For traders that have to go to a J.O.B., if you took even 1 hour each morning to trade from one fibo level to another, you would be able to retire within the year! (theoretically of course!)

We all know that trading just 20 pips a day with 1 standard lot will give you a nice income of \$50,000 a year! Please practice proper money management! Grow your account slowly and safely. To safely trade one standard lot, you would need a minimum account size of \$5000 or more.

I would highly recommend [FXChoice](#) (if you are a U.S. or Canadian trader) or [Pepperstone](#) or [HotForex](#) (if you are a non-U.S. trader) as your ECN broker. Trading with [FXChoice](#) broker will allow you to have 200:1 leverage and hedging and scalping abilities.

Here's my video that shows you how to trade off the retracements, the bounce between fibo levels in a range market:

<http://www.youtube.com/watch?v=bRPrhYVb3O0>

Like my video says, this is just one strategy of how to trade using fibo levels.

If you want to take a video course to learn more about using fibonnaci to trade the forex market, I highly recommend this video training series called FibMaster:

<http://scrnch.me/Cynthia/Recommends/FibMasterVideos>

More about FibMasters video training:

Fibonacci trading has been used to produce great results in stock trading for years. In fact, it has been described as 'trading voodoo' because its ability to predict retracements is so uncanny. Now there is a Fibonacci trading method that can be used to trade currency on the forex market as well as for stocks, options and futures. Neal Hughes' method can be used on all of these markets with equally solid results.

However, some of the examples in the video focus on stock trading so you do need to translate to the forex market. If you are a complete beginner trader, this might be confusing and difficult to do...so it's easier if you have some forex trading experience.

You can start with a simple technique in your demo account until you master it and then gradually add to your system as you master more aspects of the fibonacci retracement and target techniques.

If you have not tried trading with Fibonacci charts before, I think you will find this method a real eye opener. If you have, Neal Hughes will almost certainly introduce you to systems and tips that you have not seen before.

What You Get

With the FibMaster method you get two stand alone video training courses. The first is an introduction to Fibonacci trading and the systems that you can use. Following on from that is the advanced Fibonacci trading course. In total, 21 video tutorials are provided, totaling over 3 hours of training.

Subjects include: how Fibonacci trading works, advice on entry and exit levels plus stops, when to take your profit, day trading and longer term trading strategies, how to stack the odds in your favor, and more.

Since you now already have the AutoFibZone Indicator, you don't have to learn how to plot the fib lines on your charts...the indicator does that for you. This is an advantage.

What you do need to do is to learn how to use the fib lines to trade successfully, with the odds more in your favor. The FibMaster videos will teach you how to do this.

The product is sold by Clickbank which offers a full money back guarantee for 8 weeks from the date of purchase. So you can buy and try it out in your demo account for a full two months without risk.

I highly recommend the Fibonacci trading system demonstrated in the FibMaster videos if you are a forex trader looking for a new and profitable method of price movement prediction. FibMaster is the easiest and best way to profit from Fibonacci trading that I have seen.

Here's the link again to order FibMaster...it's only \$79 and will make you one:

<http://scrnch.me/Cynthia/Recommends/FibMasterVideos>

TRADING RETRACEMENTS

Trading retracements and scaling in or out of trades based on retracements is the advanced way to trade and can bank you many many more pips than just a straight one-position trade.

The video below gives you a slight idea of the money management taught in the MAX course. It has to do with the number of lots you open an order with and then how many you close. This video gives you a pretty good idea of how profitable the MAX system is:

<http://www.youtube.com/v/GT-iYqxpTQ>

If you want to really learn how to trade this way, you should take the MAX course if you have the time to study and practice. Eusebio, the MAX Master Trainer and accomplished students actually get upset if they don't make 500 pips day! It's the most effective trading method & training for making 50% to 500% more profits out of ordinary trend trades.

It's all in the lot sizes for entries and exits, scaling in and out of retracements and adding to your positions as the trade gathers momentum in your direction. The amount risked is small – typically about 2-3% throughout the length of the trade sequence ...there are secrets and details that only a full month course can teach you.

If you are interested, please visit my MAX site to learn more and sign up for a FREE live introductory webinar that is held each month or so:

http://www.cynthia-recommends.info/The_MAX_Trading_System.htm

MY BREAKOUT SCALPING EA TRADE MANAGER

Like to scalp? You need a trade manager to help you! I have the perfect one!

Manual scalping in a fast 1 min and 5 min chart is fun, profitable and easy!

The Breakout Scalping EA manages my trade after I place it, with a 5 pip trailing stop after it moves the trade to breakeven.

I use the Breakout EA with my Advanced Breakout Simple System with a 15 min chart open to see the major trend, a 5 min chart to identify the pullbacks, and the 1 min chart to get the best entries.

Here's two videos I made showing how to scalp using my Breakout Scalping EA using my Advanced Breakout Simple System:

http://www.youtube.com/watch?v=R4Ac_-tA2Wk
<http://www.youtube.com/watch?v=9Q4PeXpaars>

How to get the Breakout Scalping Alert EA for free:

<http://day-trade-forex.com/free-trade-manager-ea/>

UPDATE! NEW!

Here's a video showing how I trade using the new Xtra Advanced Breakout Simple System and how you can get it if you don't have it yet:

http://www.youtube.com/watch?v=d_KqAJUGAN8

Head on over to my new FaceBook page:

"Like" it and "Share" it and make a post about something forex, tell everyone what you like, hate, love, whatever!!

==>>> <https://www.facebook.com/DayTradeForex>

I hope you enjoy trading the Breakout Advanced Simple System with color, triangle breakouts and the auto-fibonacci levels and heat map and that you make many easy, stress-free, fun pips every day!

Happy Trading!

Cynthia of Day Trade Forex
